

GOOSE

VS

DUCK

Simplified , logic-based model workflow

[cite: 1]
**STEP 1:
GET DATA**

Read image files and store initial data.

[cite: 2]
**STEP 2:
CLEAN DATA**

Convert to grayscale, resize images, normalise pixels (0-1).

[cite: 3]
**STEP 3:
TRAIN THE
BRAIN**

Learn patterns from majority of data to build model.

[cite: 4]
**STEP 4:
GET NEW
DATA**

Acquire new pictures for prediction.

[cite: 5]
**STEP 5:
PREDICT**

Use trained brain to guess what the new picture is.

[cite: 6]
**STEP 6:
COMPARE
& SCORE**

Check results against known truths to measure accuracy.

Confusion Matrix

Prediction: 2/4 correct

Pred: goose
True: goose

Pred: goose
True: duck

Pred: goose
True: duck

Pred: goose
True: goose

----- Evaluation -----
Accuracy: 50.00%

Classification Report:

		precision	recall	f1-score	support
	duck	0.00	0.00	0.00	2
	goose	0.50	1.00	0.67	2
	accuracy			0.50	4
	macro avg	0.25	0.50	0.33	4
	weighted avg	0.25	0.50	0.33	4
